Indian Factory News Story Headline

December 2010

Due to increasing global demand for the unique, high-quality **PARAWEB®** and **PARALINK®** soil reinforcement products, Linear Composites Ltd has completed the commissioning of a state-of-the-art production facility in Pune, India. This complements the existing facilities in Yorkshire, UK. The new facility Maccaferri Environmental Solutions Pty Ltd (MESPL) has been awarded the ISO 19001:2008 Quality Management Standard and doubles the available manufacturing capacity of these ranges of products for LCL.

Commercial Director, Steve Miller said "This brand new facility allows us to be more responsive to the demands of the global market through increased capacity and reduced shipping times. In this era of austerity, we seem to be bucking the trend by selling more of a high quality product, rather than the opposite."

PARAWEB® and **PARALINK®** are high performance products for soil reinforcement applications. Featuring polyester strength elements, sheathed in a robust polyethylene sheath, the products offer the best long term design strength reduction factors in the marketplace today. Steve Miller adds: "No other geogrid comes close to this performance. **PARAWEB®** was first used in Department of Transport projects in 1977. This is a long pedigree and customers are confident of the quality of our products in their demanding projects, particularly major infrastructure and mining works where the high loads and aggressive conditions require high performance sheathed geogrids, rather than the lighter-weight woven or extruded grids."
